

Technical Bug Troubleshooting Guide

1. Common Technical Issues & Solutions

Most technical issues resolve with simple troubleshooting. Start with browser cache clearing and device restart. Check system requirements and internet connectivity. Many bugs are browser-specific. Try different browser to narrow down.

Troubleshooting Checklist:

- Check internet connection speed (minimum 5 Mbps required)
- Clear browser cache, cookies, and local storage
- Disable browser extensions (ad-blockers, VPNs)
- Restart browser and device
- Try incognito/private browsing window
- Update browser to latest version
- Check system requirements match device OS

System Requirements:

Desktop: Chrome/Firefox/Safari 2023+, 4GB RAM minimum, 100MB storage

Mobile: iOS 14+ or Android 8.0+, 2GB RAM, 50MB storage

Network: Stable broadband connection, 5 Mbps minimum bandwidth

Display: 1024x768 minimum resolution for desktop view

2. Specific Bug Fixes

Application freezes or crashes are usually caused by outdated browser, conflicting extensions, or insufficient memory. Pages load slowly when bandwidth is limited or server is temporarily overloaded. Error messages usually have error codes for support.

Issue: Page Won't Load

Fix: Hard refresh page (Ctrl+Shift+R or Cmd+Shift+R), check internet connection, try different network (mobile data or WiFi). If API endpoint is down, you'll see 503 error. Check status page at status.company.com.

Issue: Slow Performance

Fix: Close other tabs/applications, clear browser cache, disable extensions temporarily, restart browser. Check Task Manager (Windows) or Activity Monitor (Mac) for memory/CPU usage. Upgrade RAM if consistently above 80% utilization.

Issue: Login Loop (Infinite Redirects)

Fix: Clear cookies completely (all sites), delete browser local storage, disable VPN/proxy, enable cookies in browser settings. Try different browser to verify. Contact support if still failing after these steps.

Issue: Feature Not Working

Fix: Verify feature is available in your plan, check permissions settings, hard refresh page, re-login. Disable browser extensions one by one to find conflicting extension. Report specific error message to support.

3. Reporting Bugs & Support

When reporting bugs, provide detailed information: reproduction steps, browser/device details, error messages, screenshots. This helps our team fix issues quickly. Include username and account ID if available. Browser console logs helpful for developers.

How to Report Bugs:

1. Go to Help → Report Bug in application
2. Describe issue with step-by-step reproduction
3. Include browser type and version
4. Attach screenshots or screen recording
5. Note when issue started occurring
6. Submit and note ticket ID

Getting Browser Information:

Chrome: Menu → Help → About Google Chrome (auto-updates)

Firefox: Menu → Help → About Firefox

Safari: Safari Menu → About Safari

Edge: Menu (3 dots) → Help → About Microsoft Edge

Emergency Technical Support:

For critical bugs preventing all access:

Email: bugs@company.com

Phone: 1-800-TECHHELP

Chat: Support dashboard (real-time)

Status Updates: status.company.com

Response: 15-30 minutes for critical issues

Monitoring & Updates:

Subscribe to status page for system maintenance notifications. Updates deployed Tuesdays 2AM-4AM EST with advanced notice. No data loss during updates. Your account auto-recovers to previous state after restart.
